

# Non-existence of extremals for the second conformal eigenvalue of the conformal laplacian in small dimensions

CRM Workshop “Analysis of Geometric Singularities”

Bruno Premoselli

In collaboration with J. Vétois (Mc Gill University)

May 13<sup>th</sup>, 2024

# Current Section

- 1 Conformal eigenvalues of the conformal Laplacian
- 2 A particular case:  $\Lambda_1(M, [g])$  or the Yamabe problem
- 3 Extremals for  $\Lambda_2(M, [g])$  and main result
- 4 Euler-Lagrange equation for  $\Lambda_2(M, [g])$
- 5 Sketch of the proof of our main result

# The Conformal Laplacian

Throughout this talk  $(M^n, g)$  will be a **closed** manifold of dimension  $n \geq 3$ .  
the **conformal laplacian** of  $g$  is

$$L_g = \Delta_g + \frac{n-2}{4(n-1)} S_g$$

where  $\Delta_g = -\operatorname{div}_g(\nabla \cdot)$  and  $S_g$  is the scalar curvature.

# The Conformal Laplacian

Throughout this talk  $(M^n, g)$  will be a **closed** manifold of dimension  $n \geq 3$ .  
the **conformal laplacian of  $g$**  is

$$L_g = \Delta_g + \frac{n-2}{4(n-1)} S_g$$

where  $\Delta_g = -\operatorname{div}_g(\nabla \cdot)$  and  $S_g$  is the scalar curvature.

This operator is conformally invariant: if  $u \in C^\infty(M)$ ,  $u > 0$ , and  
 $g_u = u^{\frac{4}{n-2}} g$ ,

$$L_g(uf) = u^{\frac{n+2}{n-2}} L_{g_u}(f) \quad \text{for any } f \in C^\infty(M).$$

# The Conformal Laplacian

Throughout this talk  $(M^n, g)$  will be a **closed** manifold of dimension  $n \geq 3$ .  
the **conformal laplacian of  $g$**  is

$$L_g = \Delta_g + \frac{n-2}{4(n-1)} S_g$$

where  $\Delta_g = -\operatorname{div}_g(\nabla \cdot)$  and  $S_g$  is the scalar curvature.

This operator is conformally invariant: if  $u \in C^\infty(M)$ ,  $u > 0$ , and  $g_u = u^{\frac{4}{n-2}} g$ ,

$$L_g(uf) = u^{\frac{n+2}{n-2}} L_{g_u}(f) \quad \text{for any } f \in C^\infty(M).$$

In particular:

$$\int_M f L_{g_u} f dv_{g_u} = \int_M (uf) L_g(uf) dv_g.$$

## Conformal eigenvalues

We will assume that  $(M^n, g)$  is of **positive Yamabe type**, which means that  $L_g > 0$ . This is for instance the case if  $S_g > 0$ .

## Conformal eigenvalues

We will assume that  $(M^n, g)$  is of **positive Yamabe type**, which means that  $L_g > 0$ . This is for instance the case if  $S_g > 0$ . Denote the (discrete) spectrum of  $L_g$  by:

$$0 < \lambda_1(g) < \lambda_2(g) \leq \lambda_3(g) \leq \dots$$

## Conformal eigenvalues

We will assume that  $(M^n, g)$  is of positive Yamabe type, which means that  $L_g > 0$ . This is for instance the case if  $S_g > 0$ . Denote the (discrete) spectrum of  $L_g$  by:

$$0 < \lambda_1(g) < \lambda_2(g) \leq \lambda_3(g) \leq \dots$$

For  $k \geq 1$  we define the  $k$ -th conformal eigenvalue of  $L_g$  as:

$$\Lambda_k(M, [g]) = \inf_{\tilde{g} \in [g]} \left( \lambda_k(\tilde{g}) \text{Vol}(M, \tilde{g})^{\frac{2}{n}} \right).$$

## Conformal eigenvalues

We will assume that  $(M^n, g)$  is of **positive Yamabe type**, which means that  $L_g > 0$ . This is for instance the case if  $S_g > 0$ . Denote the (discrete) spectrum of  $L_g$  by:

$$0 < \lambda_1(g) < \lambda_2(g) \leq \lambda_3(g) \leq \dots$$

For  $k \geq 1$  we define the  $k$ -th conformal eigenvalue of  $L_g$  as:

$$\Lambda_k(M, [g]) = \inf_{\tilde{g} \in [g]} \left( \lambda_k(\tilde{g}) \text{Vol}(M, \tilde{g})^{\frac{2}{n}} \right).$$

Write  $\tilde{g} = u^{\frac{4}{n-2}} g$ . Then  $\text{Vol}(M, \tilde{g}) = \int_M u^{\frac{2n}{n-2}} dv_g$  and

## Conformal eigenvalues

We will assume that  $(M^n, g)$  is of **positive Yamabe type**, which means that  $L_g > 0$ . This is for instance the case if  $S_g > 0$ . Denote the (discrete) spectrum of  $L_g$  by:

$$0 < \lambda_1(g) < \lambda_2(g) \leq \lambda_3(g) \leq \dots$$

For  $k \geq 1$  we define the  $k$ -th conformal eigenvalue of  $L_g$  as:

$$\Lambda_k(M, [g]) = \inf_{\tilde{g} \in [g]} \left( \lambda_k(\tilde{g}) \text{Vol}(M, \tilde{g})^{\frac{2}{n}} \right).$$

Write  $\tilde{g} = u^{\frac{4}{n-2}} g$ . Then  $\text{Vol}(M, \tilde{g}) = \int_M u^{\frac{2n}{n-2}} dv_g$  and

$$\Lambda_k(M, [g]) = \inf_{\substack{u \in C^\infty(M) \\ u > 0}} \lambda_k(g_u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}.$$

# Generalities

By [Ammann-Jammes '08], for any  $k \geq 1$ ,

$$\sup_{\substack{u \in C^\infty(M) \\ u > 0}} \lambda_k(g_u) \text{Vol}(M, g_u)^{\frac{2}{n}} = +\infty.$$

This is due to [the conformal invariance](#) of  $L_g$  that allows for asymptotically cylindrical blow-up (Pinocchio metrics).

# Generalities

By [Ammann-Jammes '08], for any  $k \geq 1$ ,

$$\sup_{\substack{u \in C^\infty(M) \\ u > 0}} \lambda_k(g_u) \text{Vol}(M, g_u)^{\frac{2}{n}} = +\infty.$$

This is due to **the conformal invariance** of  $L_g$  that allows for asymptotically cylindrical blow-up (Pinocchio metrics).

**Our goal today:** investigate **under which conditions the second conformal eigenvalue  $\Lambda_2(M, [g])$  is attained** (we will give a precise definition of what its extremals are).

# Generalities

By [Ammann-Jammes '08], for any  $k \geq 1$ ,

$$\sup_{\substack{u \in C^\infty(M) \\ u > 0}} \lambda_k(g_u) \text{Vol}(M, g_u)^{\frac{2}{n}} = +\infty.$$

This is due to the conformal invariance of  $L_g$  that allows for asymptotically cylindrical blow-up (Pinocchio metrics).

**Our goal today:** investigate under which conditions the second conformal eigenvalue  $\Lambda_2(M, [g])$  is attained (we will give a precise definition of what its extremals are).

**A remark:** our  $\Lambda_k(M, [g])$  are an infimum, and this creates big conceptual difference with the maximisation problem of conformal eigenvalues of the Laplacian in dimensions  $n \geq 2$  ([Nadirashvili-Sire '15], [Pétrides '18, '22], [Karpukhin-Stern '20, '22]). We will restrict to the conformal case here.

# Current Section

- 1 Conformal eigenvalues of the conformal Laplacian
- 2 A particular case:  $\Lambda_1(M, [g])$  or the Yamabe problem

# The Yamabe problem

Recall the definition of the **Yamabe invariant** of  $[g]$ :

$$Y(M, [g]) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f \cdot L_g f dv_g}{\left( \int_M |f|^{\frac{2n}{n-2}} dv_g \right)^{\frac{n-2}{n}}} > 0.$$

# The Yamabe problem

Recall the definition of the **Yamabe invariant** of  $[g]$ :

$$Y(M, [g]) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f \cdot L_g f dv_g}{\left( \int_M |f|^{\frac{2n}{n-2}} dv_g \right)^{\frac{n-2}{n}}} > 0.$$

Investigated by [Yamabe '60], [Trudinger '68], [Aubin '76], [Schoen '84].

# The Yamabe problem

Recall the definition of the **Yamabe invariant** of  $[g]$ :

$$Y(M, [g]) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f \cdot L_g f dv_g}{\left( \int_M |f|^{\frac{2n}{n-2}} dv_g \right)^{\frac{n-2}{n}}} > 0.$$

Investigated by [Yamabe '60], [Trudinger '68], [Aubin '76], [Schoen '84]. It turns out that the Yamabe invariant is equal to the first conformal eigenvalue  $\Lambda_1(M, [g])$ :

$$Y(M, [g]) = \Lambda_1(M, [g]).$$

The Yamabe problem – proof that  $Y(M, [g]) = \Lambda_1(M, [g])$ .

Proof.

Since  $dv_{g_u} = u^{\frac{2n}{n-2}} dv_g$  we have, letting  $h = uf$ ,

$$\lambda_1(g_u) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f L_{g_u} f dv_{g_u}}{\int_M f^2 dv_{g_u}}$$

The Yamabe problem – proof that  $Y(M, [g]) = \Lambda_1(M, [g])$ .

Proof.

Since  $dv_{g_u} = u^{\frac{2n}{n-2}} dv_g$  we have, letting  $h = uf$ ,

$$\lambda_1(g_u) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f L_{g_u} f dv_{g_u}}{\int_M f^2 dv_{g_u}} = \inf_{h \in C^\infty(M) \setminus \{0\}} \frac{\int_M h L_g h dv_g}{\int_M u^{\frac{4}{n-2}} h^2 dv_g}.$$

The Yamabe problem – proof that  $Y(M, [g]) = \Lambda_1(M, [g])$ .

Proof.

Since  $dv_{g_u} = u^{\frac{2n}{n-2}} dv_g$  we have, letting  $h = uf$ ,

$$\lambda_1(g_u) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f L_{g_u} f dv_{g_u}}{\int_M f^2 dv_{g_u}} = \inf_{h \in C^\infty(M) \setminus \{0\}} \frac{\int_M h L_g h dv_g}{\int_M u^{\frac{4}{n-2}} h^2 dv_g}.$$

Choose  $h = u$  in  $\lambda_1(g_u)$ . Then

$$\Lambda_1(M, [g]) \leq \lambda_1(g_u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}$$

# The Yamabe problem – proof that $Y(M, [g]) = \Lambda_1(M, [g])$ .

Proof.

Since  $dv_{g_u} = u^{\frac{2n}{n-2}} dv_g$  we have, letting  $h = uf$ ,

$$\lambda_1(g_u) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f L_{g_u} f dv_{g_u}}{\int_M f^2 dv_{g_u}} = \inf_{h \in C^\infty(M) \setminus \{0\}} \frac{\int_M h L_g h dv_g}{\int_M u^{\frac{4}{n-2}} h^2 dv_g}.$$

Choose  $h = u$  in  $\lambda_1(g_u)$ . Then

$$\Lambda_1(M, [g]) \leq \lambda_1(g_u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}} \leq \frac{\int_M u L_g u dv_g}{\left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{n-2}{n}}}.$$

The Yamabe problem – proof that  $Y(M, [g]) = \Lambda_1(M, [g])$ .

Proof.

Since  $dv_{g_u} = u^{\frac{2n}{n-2}} dv_g$  we have, letting  $h = uf$ ,

$$\lambda_1(g_u) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f L_{g_u} f dv_{g_u}}{\int_M f^2 dv_{g_u}} = \inf_{h \in C^\infty(M) \setminus \{0\}} \frac{\int_M h L_g h dv_g}{\int_M u^{\frac{4}{n-2}} h^2 dv_g}.$$

Choose  $h = u$  in  $\lambda_1(g_u)$ . Then

$$\Lambda_1(M, [g]) \leq \lambda_1(g_u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}} \leq \frac{\int_M u L_g u dv_g}{\left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{n-2}{n}}}.$$

Taking the infimum over  $u$  yields  $\Lambda_1(M, [g]) \leq Y(M, [g])$ .

The Yamabe problem – proof that  $Y(M, [g]) = \Lambda_1(M, [g])$ .

Proof.

Since  $dv_{g_u} = u^{\frac{2n}{n-2}} dv_g$  we have, letting  $h = uf$ ,

$$\lambda_1(g_u) = \inf_{f \in C^\infty(M) \setminus \{0\}} \frac{\int_M f L_{g_u} f dv_{g_u}}{\int_M f^2 dv_{g_u}} = \inf_{h \in C^\infty(M) \setminus \{0\}} \frac{\int_M h L_g h dv_g}{\int_M u^{\frac{4}{n-2}} h^2 dv_g}.$$

Choose  $h = u$  in  $\lambda_1(g_u)$ . Then

$$\Lambda_1(M, [g]) \leq \lambda_1(g_u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}} \leq \frac{\int_M u L_g u dv_g}{\left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{n-2}{n}}}.$$

Taking the infimum over  $u$  yields  $\Lambda_1(M, [g]) \leq Y(M, [g])$ .

The other inequality follows from Hölder's inequality:

$$\int_M u^{\frac{4}{n-2}} f^2 dv_g \leq \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}} \left( \int_M |f|^{\frac{2n}{n-2}} dv_g \right)^{\frac{n-2}{n}}.$$

# The Yamabe problem - extremals

[Aubin '76] showed that if

$$\Lambda_1(M, [g]) < \Lambda_1(\mathbb{S}^n, [g_0]) \quad (*)$$

where  $g_0$  is the round metric, then  $\Lambda_1(M, [g])$  is attained. He showed (\*) when  $n \geq 6$  and  $(M, g)$  is not l.c.f.

# The Yamabe problem - extremals

[Aubin '76] showed that if

$$\Lambda_1(M, [g]) < \Lambda_1(\mathbb{S}^n, [g_0]) \quad (*)$$

where  $g_0$  is the round metric, then  $\Lambda_1(M, [g])$  is attained. He showed (\*) when  $n \geq 6$  and  $(M, g)$  is not l.c.f. [Schoen '84] proved (\*) in dimensions  $3 \leq n \leq 5$  or when  $(M, g)$  is l.c.f.

# The Yamabe problem - extremals

[Aubin '76] showed that if

$$\Lambda_1(M, [g]) < \Lambda_1(\mathbb{S}^n, [g_0]) \quad (*)$$

where  $g_0$  is the round metric, then  $\Lambda_1(M, [g])$  is attained. He showed (\*) when  $n \geq 6$  and  $(M, g)$  is not l.c.f. [Schoen '84] proved (\*) in dimensions  $3 \leq n \leq 5$  or when  $(M, g)$  is l.c.f.

Minimisers attaining  $\Lambda_1(M, [g])$  (or  $Y(M, [g])$ ) are **positive least-energy solutions** of the Yamabe equation:

$$L_g u = u^{\frac{n+2}{n-2}} \quad \text{in } M$$

with

$$L_g = \Delta_g u + \frac{n-2}{4(n-1)} S_g.$$

# Current Section

- 2 A particular case:  $\Lambda_1(M, [g])$  or the Yamabe problem
- 3 Extremals for  $\Lambda_2(M, [g])$  and main result**
- 4 Euler-Lagrange equation for  $\Lambda_2(M, [g])$
- 5 Sketch of the proof of our main result

Attaining  $\Lambda_2(M, [g])$ .

[Ammann-Humbert '06] showed that if

$$\Lambda_2(M, [g])^{\frac{n}{2}} < \Lambda_1(M, [g])^{\frac{n}{2}} + \Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} \quad (**)$$

where  $g_0$  is the round metric in  $\mathbb{S}^n$ , then  $\Lambda_2(M, [g])$  is attained.

Attaining  $\Lambda_2(M, [g])$ .

[Ammann-Humbert '06] showed that if

$$\Lambda_2(M, [g])^{\frac{n}{2}} < \Lambda_1(M, [g])^{\frac{n}{2}} + \Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} \quad (**)$$

where  $g_0$  is the round metric in  $\mathbb{S}^n$ , then  $\Lambda_2(M, [g])$  is attained.

[Ammann-Humbert '06] also prove by test-functions computations that

(\*\*) is satisfied if  $n \geq 11$  AND  $(M, g)$  is not l.c.f

and that the large inequality in (\*\*) is always satisfied.

Attaining  $\Lambda_2(M, [g])$ .

[Ammann-Humbert '06] showed that if

$$\Lambda_2(M, [g])^{\frac{n}{2}} < \Lambda_1(M, [g])^{\frac{n}{2}} + \Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} \quad (**)$$

where  $g_0$  is the round metric in  $\mathbb{S}^n$ , then  $\Lambda_2(M, [g])$  is attained.

[Ammann-Humbert '06] also prove by test-functions computations that

(\*\*) is satisfied if  $n \geq 11$  AND  $(M, g)$  is not l.c.f

and that the large inequality in (\*\*) is always satisfied. The proof uses test-functions computations similar to the ones in the Yamabe problem.

Attaining  $\Lambda_2(M, [g])$ .

[Ammann-Humbert '06] showed that if

$$\Lambda_2(M, [g])^{\frac{n}{2}} < \Lambda_1(M, [g])^{\frac{n}{2}} + \Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} \quad (**)$$

where  $g_0$  is the round metric in  $\mathbb{S}^n$ , then  $\Lambda_2(M, [g])$  is attained.

[Ammann-Humbert '06] also prove by test-functions computations that

(\*\*) is satisfied if  $n \geq 11$  AND  $(M, g)$  is not l.c.f

and that the large inequality in (\*\*) is always satisfied. The proof uses test-functions computations similar to the ones in the Yamabe problem. The geometric meaning of inequality (\*\*) is the following:

$$\Lambda_2(M, [g]) < \Lambda_2(M \sqcup \mathbb{S}^n, [g] \sqcup [g_0]).$$

Attaining  $\Lambda_2(M, [g])$ .

[Ammann-Humbert '06] showed that if

$$\Lambda_2(M, [g])^{\frac{n}{2}} < \Lambda_1(M, [g])^{\frac{n}{2}} + \Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} \quad (**)$$

where  $g_0$  is the round metric in  $\mathbb{S}^n$ , then  $\Lambda_2(M, [g])$  is attained.

[Ammann-Humbert '06] also prove by test-functions computations that

(\*\*) is satisfied if  $n \geq 11$  AND  $(M, g)$  is not l.c.f

and that the large inequality in (\*\*) is always satisfied. The proof uses test-functions computations similar to the ones in the Yamabe problem. The geometric meaning of inequality (\*\*) is the following:

$$\Lambda_2(M, [g]) < \Lambda_2(M \sqcup \mathbb{S}^n, [g] \sqcup [g_0]).$$

We address here the low-dimensional case  $n \leq 10$ . Our main result states can (\*\*) can no longer be expected to hold in general.

# Nonexistence of extremals for $\Lambda_2(M, [g])$ when $n \leq 10$

Our main result shows that, in dimensions  $n \leq 10$ , metrics in  $\mathbb{S}^n$  that are close enough to the round metric **do not attain**  $\Lambda_2$ :

# Nonexistence of extremals for $\Lambda_2(M, [g])$ when $n \leq 10$

Our main result shows that, in dimensions  $n \leq 10$ , metrics in  $\mathbb{S}^n$  that are close enough to the round metric **do not attain  $\Lambda_2$** :

Theorem (P.-Vétois, '24)

Assume that  $3 \leq n \leq 10$ . There exists  $m \in \mathbb{N}^*$  and  $\delta > 0$  such that for every smooth metric  $g$  in  $\mathbb{S}^n$  with  $\|g - g_0\|_{C^m} < \delta$  we have

$$\Lambda_2(\mathbb{S}^n, [g])^{\frac{n}{2}} = \Lambda_1(\mathbb{S}^n, [g])^{\frac{n}{2}} + \Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$$

and  $\Lambda_2(\mathbb{S}^n, [g])^{\frac{n}{2}}$  is not attained.

## Remarks on our main result

- [Ammann-Humbert '06] showed that  $\Lambda_2(\mathbb{S}^n, [g_0])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and that it is never attained.

## Remarks on our main result

- [Ammann-Humbert '06] showed that  $\Lambda_2(\mathbb{S}^n, [g_0])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and that it is never attained. Our Theorem has to be understood as a **stability result for the non-existence of extremals for  $\Lambda_2$**  for  $g$  close to the round metric  $g_0$  in  $\mathbb{S}^n$ .

## Remarks on our main result

- [Ammann-Humbert '06] showed that  $\Lambda_2(\mathbb{S}^n, [g_0])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and that it is never attained. Our Theorem has to be understood as a **stability result for the non-existence of extremals for  $\Lambda_2$**  for  $g$  close to the round metric  $g_0$  in  $\mathbb{S}^n$ .
- Our Theorem is also the first **non-existence result of extremals** for conformal eigenvalues on manifolds that are not standard spheres (in all contexts).

## Remarks on our main result

- [Ammann-Humbert '06] showed that  $\Lambda_2(\mathbb{S}^n, [g_0])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and that it is never attained. Our Theorem has to be understood as a **stability result for the non-existence of extremals for  $\Lambda_2$**  for  $g$  close to the round metric  $g_0$  in  $\mathbb{S}^n$ .
- Our Theorem is also the first **non-existence result of extremals** for conformal eigenvalues on manifolds that are not standard spheres (in all contexts).
- This result shows a striking difference with the  $n \geq 11$  case: when  $n \leq 10$ , one cannot guarantee anymore that  $\Lambda_2(M, [g])$  is attained **solely by enforcing local conditions on  $g$** .

## Remarks on our main result

- [Ammann-Humbert '06] showed that  $\Lambda_2(\mathbb{S}^n, [g_0])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and that it is never attained. Our Theorem has to be understood as a **stability result for the non-existence of extremals for  $\Lambda_2$**  for  $g$  close to the round metric  $g_0$  in  $\mathbb{S}^n$ .
- Our Theorem is also the first **non-existence result of extremals** for conformal eigenvalues on manifolds that are not standard spheres (in all contexts).
- This result shows a striking difference with the  $n \geq 11$  case: when  $n \leq 10$ , one cannot guarantee anymore that  $\Lambda_2(M, [g])$  is attained **solely by enforcing local conditions on  $g$** . New ideas are needed to produce examples of manifolds of dimension  $n \leq 10$  where  $\Lambda_2(M, [g])$  is attained, with or without equality for  $\Lambda_2(M, [g])$ .

## Variational characterisation of $\Lambda_k(M, [g])$

For  $u \in C^\infty(M)$ ,  $u > 0$  let  $g_u = u^{\frac{4}{n-2}}g$ . The classical variational characterisation of  $\lambda_k(g)$  and conformal invariance show that:

$$\lambda_k(u) = \lambda_k(g_u) = \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_{g_u} v dv_{g_u}}{\int_M v^2 dv_{g_u}}$$

## Variational characterisation of $\Lambda_k(M, [g])$

For  $u \in C^\infty(M)$ ,  $u > 0$  let  $g_u = u^{\frac{4}{n-2}} g$ . The classical variational characterisation of  $\lambda_k(g)$  and conformal invariance show that:

$$\begin{aligned}\lambda_k(u) = \lambda_k(g_u) &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_{g_u} v dv_{g_u}}{\int_M v^2 dv_{g_u}} \\ &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_g v dv_g}{\int_M u^{\frac{4}{n-2}} v^2 dv_g}.\end{aligned}$$

## Variational characterisation of $\Lambda_k(M, [g])$

For  $u \in C^\infty(M)$ ,  $u > 0$  let  $g_u = u^{\frac{4}{n-2}}g$ . The classical variational characterisation of  $\lambda_k(g)$  and conformal invariance show that:

$$\begin{aligned}\lambda_k(u) = \lambda_k(g_u) &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_{g_u} v dv_{g_u}}{\int_M v^2 dv_{g_u}} \\ &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_g v dv_g}{\int_M u^{\frac{4}{n-2}} v^2 dv_g}.\end{aligned}$$

The right-hand side still makes sense when  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$ .

## Variational characterisation of $\Lambda_k(M, [g])$

For  $u \in C^\infty(M)$ ,  $u > 0$  let  $g_u = u^{\frac{4}{n-2}}g$ . The classical variational characterisation of  $\lambda_k(g)$  and conformal invariance show that:

$$\begin{aligned}\lambda_k(u) = \lambda_k(g_u) &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_{g_u} v dv_{g_u}}{\int_M v^2 dv_{g_u}} \\ &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_g v dv_g}{\int_M u^{\frac{4}{n-2}} v^2 dv_g}.\end{aligned}$$

The right-hand side still makes sense when  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$ . This defines a quantity that we denote by  $\lambda_k(u)$  and that we call a generalised eigenvalue.

## Variational characterisation of $\Lambda_k(M, [g])$

For  $u \in C^\infty(M)$ ,  $u > 0$  let  $g_u = u^{\frac{4}{n-2}}g$ . The classical variational characterisation of  $\lambda_k(g)$  and conformal invariance show that:

$$\begin{aligned}\lambda_k(u) = \lambda_k(g_u) &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_{g_u} v dv_{g_u}}{\int_M v^2 dv_{g_u}} \\ &= \inf_{\substack{\dim V=k \\ V \subset H^1(M)}} \sup_{v \in V \setminus \{0\}} \frac{\int_M v L_g v dv_g}{\int_M u^{\frac{4}{n-2}} v^2 dv_g}.\end{aligned}$$

The right-hand side still makes sense when  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$ . This defines a quantity that we denote by  $\lambda_k(u)$  and that we call a **generalised eigenvalue**. To a generalised eigenvalue  $\lambda_k(u)$  one can associate one (or more) **generalised eigenvectors**  $\varphi \in H^1(M)$  solving

$$L_g \varphi = \lambda_k(u) u^{\frac{4}{n-2}} \varphi \quad \text{in } M, \quad \int_M u^{\frac{4}{n-2}} \varphi^2 dv_g = 1.$$

# Extremals for $\Lambda_k(M, [g])$

## Definition

We say that  $\Lambda_k(M, [g])$  is attained if there exists  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  such that

$$\Lambda_k(M, [g]) = \lambda_k(u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}.$$

# Extremals for $\Lambda_k(M, [g])$

## Definition

We say that  $\Lambda_k(M, [g])$  is attained if there exists  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  such that

$$\Lambda_k(M, [g]) = \lambda_k(u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}.$$

When  $k = 1$ , we saw that  $\Lambda_1(M, [g]) = Y(M, [g])$ .

# Extremals for $\Lambda_k(M, [g])$

## Definition

We say that  $\Lambda_k(M, [g])$  is attained if there exists  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  such that

$$\Lambda_k(M, [g]) = \lambda_k(u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}.$$

When  $k = 1$ , we saw that  $\Lambda_1(M, [g]) = Y(M, [g])$ . But for  $k \geq 2$ , extremals of  $\Lambda_k(M, [g])$  **cannot be attained** at a positive function  $u$  ([Ammann-Humbert '06]).

# Extremals for $\Lambda_k(M, [g])$

## Definition

We say that  $\Lambda_k(M, [g])$  is attained if there exists  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  such that

$$\Lambda_k(M, [g]) = \lambda_k(u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}.$$

When  $k = 1$ , we saw that  $\Lambda_1(M, [g]) = Y(M, [g])$ . But for  $k \geq 2$ , extremals of  $\Lambda_k(M, [g])$  **cannot be attained** at a positive function  $u$  ([Ammann-Humbert '06]).

$\Lambda_2(M, [g])$  may only be attained at a **generalised metric**  $g_u = u^{\frac{4}{n-2}} g$ , which are singular at  $\{u = 0\}$ .

## Euler-Lagrange equation for $\Lambda_2(M, [g])$

It is proven in [Ammann-Humbert '06], [Gursky-Perez Ayala '21] that IF  $\Lambda_2(M, [g])$  is attained at  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  then  $\lambda_2(u)$  is **simple**, that is spanned by a **single** non-zero normalised eigenfunction  $\varphi$  which satisfies

$$u = |\varphi|.$$

## Euler-Lagrange equation for $\Lambda_2(M, [g])$

It is proven in [Ammann-Humbert '06], [Gursky-Perez Ayala '21] that IF  $\Lambda_2(M, [g])$  is attained at  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  then  $\lambda_2(u)$  is **simple**, that is spanned by a **single** non-zero normalised eigenfunction  $\varphi$  which satisfies

$$u = |\varphi|.$$

Up to rescaling  $\varphi$ , the eigenvalue equation shows that  $\varphi$  is a **least-energy sign-changing solution** of the Yamabe equation in  $M$  attaining  $\Lambda_2(M, [g])$ :

## Euler-Lagrange equation for $\Lambda_2(M, [g])$

It is proven in [Ammann-Humbert '06], [Gursky-Perez Ayala '21] that IF  $\Lambda_2(M, [g])$  is attained at  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  then  $\lambda_2(u)$  is **simple**, that is spanned by a **single** non-zero normalised eigenfunction  $\varphi$  which satisfies

$$u = |\varphi|.$$

Up to rescaling  $\varphi$ , the eigenvalue equation shows that  $\varphi$  is a **least-energy sign-changing solution** of the Yamabe equation in  $M$  attaining  $\Lambda_2(M, [g])$ :

$$L_g \varphi = |\varphi|^{\frac{4}{n-2}} \varphi,$$

## Euler-Lagrange equation for $\Lambda_2(M, [g])$

It is proven in [Ammann-Humbert '06], [Gursky-Perez Ayala '21] that IF  $\Lambda_2(M, [g])$  is attained at  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  then  $\lambda_2(u)$  is **simple**, that is spanned by a **single** non-zero normalised eigenfunction  $\varphi$  which satisfies

$$u = |\varphi|.$$

Up to rescaling  $\varphi$ , the eigenvalue equation shows that  $\varphi$  is a **least-energy sign-changing solution** of the Yamabe equation in  $M$  attaining  $\Lambda_2(M, [g])$ :

$$L_g \varphi = |\varphi|^{\frac{4}{n-2}} \varphi, \quad \int_M |\varphi|^{\frac{2n}{n-2}} dv_g = \Lambda_2(M, [g])^{\frac{n}{2}}.$$

## Euler-Lagrange equation for $\Lambda_2(M, [g])$

It is proven in [Ammann-Humbert '06], [Gursky-Perez Ayala '21] that  $\text{IF } \Lambda_2(M, [g])$  is attained at  $u \in L^{\frac{2n}{n-2}}(M) \setminus \{0\}$ ,  $u \geq 0$  a.e. in  $M$  then  $\lambda_2(u)$  is **simple**, that is spanned by a **single** non-zero normalised eigenfunction  $\varphi$  which satisfies

$$u = |\varphi|.$$

Up to rescaling  $\varphi$ , the eigenvalue equation shows that  $\varphi$  is a **least-energy sign-changing solution** of the Yamabe equation in  $M$  attaining  $\Lambda_2(M, [g])$ :

$$L_g \varphi = |\varphi|^{\frac{4}{n-2}} \varphi, \quad \int_M |\varphi|^{\frac{2n}{n-2}} dv_g = \Lambda_2(M, [g])^{\frac{n}{2}}.$$

$\Lambda_2(M, [g])$  is thus a natural generalisation of the Yamabe problem: attaining it provides **sign-changing solutions of least energy**, whereas attaining  $\Lambda_1(M, [g])$  provided solutions of least-energy (thus positive).

$$\begin{aligned}\int_M |\varphi_k|^{\frac{2n}{n-2}} dv_{g_k} &= \Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} \\ &= \Lambda_2(\mathbb{S}^n, [g_0])^{\frac{n}{2}} + o(1) = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} + o(1)\end{aligned}$$

as  $k \rightarrow +\infty$ . Classical compactness results in  $H^1$  [Struwe '86] show that

$$\varphi_k = B_{1,k} - B_{2,k} + o(1) \quad \text{in } H^1(M)$$

where  $\int_{\mathbb{S}^n} B_{i,k}^{\frac{2n}{n-2}} dv_{g_0} = \Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$ ,

$$B_{i,k}(x) \approx \frac{\mu_{i,k}^{\frac{n-2}{2}}}{(\mu_{i,k}^2 + d_g(x_{i,k}, x)^2)^{\frac{n-2}{2}}}, \quad x \in M, \quad \mu_{i,k} \leq 1$$

and

$$L_{g_0} B_{i,k} = B_{i,k}^{\frac{n+2}{n-2}} \quad \text{in } \mathbb{S}^n.$$

# Strong convergence towards a union of spheres

The equality

$$\varphi_k = B_{1,k} - B_{2,k} + o(1) \quad \text{in } H^1(M) \quad (5.1)$$

# Strong convergence towards a union of spheres

The equality

$$\varphi_k = B_{1,k} - B_{2,k} + o(1) \quad \text{in } H^1(M) \quad (5.1)$$

is a weak bubble-tree convergence and only reformulates the quantisation  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} + o(1)$ .

# Strong convergence towards a union of spheres

The equality

$$\varphi_k = B_{1,k} - B_{2,k} + o(1) \quad \text{in } H^1(M) \quad (5.1)$$

is a weak bubble-tree convergence and only reformulates the quantisation  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} + o(1)$ .

The first ingredient in our proof consists in **turning (5.1) into smooth convergence at the scale of each sphere  $B_{i,k}$ .**

# Strong convergence towards a union of spheres

The equality

$$\varphi_k = B_{1,k} - B_{2,k} + o(1) \quad \text{in } H^1(M) \quad (5.1)$$

is a weak bubble-tree convergence and only reformulates the quantisation  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} + o(1)$ .

The first ingredient in our proof consists in **turning (5.1) into smooth convergence at the scale of each sphere  $B_{i,k}$** . We first prove that

$$\varphi_k = B_{1,k} - B_{2,k} + o(B_{1,k}) + o(B_{2,k}) \quad \text{in } C^m(M).$$

# Strong convergence towards a union of spheres

The equality

$$\varphi_k = B_{1,k} - B_{2,k} + o(1) \quad \text{in } H^1(M) \quad (5.1)$$

is a weak bubble-tree convergence and only reformulates the quantisation  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} = 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}} + o(1)$ .

The first ingredient in our proof consists in **turning (5.1) into smooth convergence at the scale of each sphere**  $B_{i,k}$ . We first prove that

$$\varphi_k = B_{1,k} - B_{2,k} + o(B_{1,k}) + o(B_{2,k}) \quad \text{in } C^m(M).$$

We then prove quantitative estimates on each sphere: something like

$$\left| \varphi_k - (B_{1,k} - B_{2,k}) \right| \lesssim \left( \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} d_{g_0}(x_{i,k}, \cdot)^{2\alpha} \right) B_{i,k},$$

in a neighbourhood of  $x_{i,k}$ , where  $\varepsilon_{\alpha,k} \sim \|\nabla^\alpha(g_k - g_0)\|_\infty^2$ .

# Strong convergence towards a union of spheres

$$\left| \varphi_k - (B_{1,k} - B_{2,k}) \right| \lesssim \left( \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} d_{g_0}(x_{i,k}, \cdot)^{2\alpha} \right) B_{i,k},$$

in a neighbourhood of  $x_{i,k}$ , where  $\varepsilon_{\alpha,k} \sim \|\nabla^\alpha(g_k - g_0)\|_\infty^2$ . Adaptation of the techniques in [P. '22], [P.-Vétois '22], [Khuri-Marques-Schoen '08].

## Strong convergence towards a union of spheres II

The previous estimates show that the “metric”  $|\varphi_k|^{\frac{4}{n-2}}g$  converges towards the disjoint union of two round spheres, smoothly outside of the centers.

## Strong convergence towards a union of spheres II

The previous estimates show that the “metric”  $|\varphi_k|^{\frac{4}{n-2}}g$  converges towards the disjoint union of two round spheres, smoothly outside of the centers.

The contradiction in our proof will come from a fine analysis of the glueing region between the two spheres, which is the neck region  $B_{1,k} \approx B_{2,k}$ .

## Strong convergence towards a union of spheres II

The previous estimates show that the “metric”  $|\varphi_k|^{\frac{4}{n-2}}g$  converges towards the disjoint union of two round spheres, smoothly outside of the centers.

The contradiction in our proof will come from a fine analysis of the glueing region between the two spheres, which is the neck region  $B_{1,k} \approx B_{2,k}$ . It is also the nodal region of  $\varphi_k$ .

## Strong convergence towards a union of spheres II

The previous estimates show that the “metric”  $|\varphi_k|^{\frac{4}{n-2}}g$  converges towards the disjoint union of two round spheres, smoothly outside of the centers.

The contradiction in our proof will come from a fine analysis of the glueing region between the two spheres, which is the neck region  $B_{1,k} \approx B_{2,k}$ . It is also the nodal region of  $\varphi_k$ . We show that when  $3 \leq n \leq 10$  it is impossible to deform  $B_{1,k} - B_{2,k}$  into a proper solution of the Yamabe equation for  $g_k$ , regardless of the nature of  $g_k$ .

## Strong convergence towards a union of spheres II

The previous estimates show that the “metric”  $|\varphi_k|^{\frac{4}{n-2}}g$  converges towards the disjoint union of two round spheres, smoothly outside of the centers.

The contradiction in our proof will come from a fine analysis of the glueing region between the two spheres, which is the neck region  $B_{1,k} \approx B_{2,k}$ . It is also the nodal region of  $\varphi_k$ . We show that when  $3 \leq n \leq 10$  it is impossible to deform  $B_{1,k} - B_{2,k}$  into a proper solution of the Yamabe equation for  $g_k$ , regardless of the nature of  $g_k$ .

The assumption  $n \leq 10$  is crucial here: it forces each profile  $B_{i,k}$  to concentrate as  $k \rightarrow +\infty$  as follows:

$$B_{i,k}(x) \approx \frac{\mu_{i,k}^{\frac{n-2}{2}}}{(\mu_{i,k}^2 + d_g(x_{i,k}, x)^2)^{\frac{n-2}{2}}}, \quad x \in M, \quad \mu_{i,k} \rightarrow 0$$

## Strong convergence towards a union of spheres II

$$B_{i,k}(x) \approx \frac{\mu_{i,k}^{\frac{n-2}{2}}}{(\mu_{i,k}^2 + d_g(x_{i,k}, x)^2)^{\frac{n-2}{2}}}, \quad x \in M, \quad \mu_{i,k} \rightarrow 0$$

for  $i = 1, 2$ . Follows from the techniques in [P. '22], [P.-Vétois '22].

## End of the proof when $3 \leq n \leq 5$

When  $3 \leq n \leq 5$  the proof follows from a [Pohozaev identity](#) applied to  $\varphi_k$  in the sphere defined by  $B_{2,k}$ , inside the neck region  $B_{1,k} \approx B_{2,k}$ .

## End of the proof when $3 \leq n \leq 5$

When  $3 \leq n \leq 5$  the proof follows from a [Pohozaev identity](#) applied to  $\varphi_k$  in the sphere defined by  $B_{2,k}$ , inside the neck region  $B_{1,k} \approx B_{2,k}$ . It gives the following compatibility condition:

$$\frac{\mu_{1,k}\mu_{2,k}}{\mu_{1,k}^2 + d_{g_0}(x_{1,k}, x_{2,k})^2} = o(\mu_{2,k}^2),$$

which is impossible since  $\mu_{2,k} \leq \mu_{1,k}$ .

## End of the proof when $3 \leq n \leq 5$

When  $3 \leq n \leq 5$  the proof follows from a [Pohozaev identity](#) applied to  $\varphi_k$  in the sphere defined by  $B_{2,k}$ , inside the neck region  $B_{1,k} \approx B_{2,k}$ . It gives the following compatibility condition:

$$\frac{\mu_{1,k}\mu_{2,k}}{\mu_{1,k}^2 + d_{g_0}(x_{1,k}, x_{2,k})^2} = o(\mu_{2,k}^2),$$

which is impossible since  $\mu_{2,k} \leq \mu_{1,k}$ . The l.h.s is an obstruction for  $B_{1,k} - B_{2,k}$  to being an exact solution of the Yamabe equation for  $g_k$ ;

## End of the proof when $3 \leq n \leq 5$

When  $3 \leq n \leq 5$  the proof follows from a **Pohozaev identity** applied to  $\varphi_k$  in the sphere defined by  $B_{2,k}$ , inside the neck region  $B_{1,k} \approx B_{2,k}$ . It gives the following compatibility condition:

$$\frac{\mu_{1,k}\mu_{2,k}}{\mu_{1,k}^2 + d_{g_0}(x_{1,k}, x_{2,k})^2} = o(\mu_{2,k}^2),$$

which is impossible since  $\mu_{2,k} \leq \mu_{1,k}$ . The l.h.s is an obstruction for  $B_{1,k} - B_{2,k}$  to being an exact solution of the Yamabe equation for  $g_k$ ; similarly, the r.h.s is an obstruction for  $B_{2,k}$  to being a solution.

## End of the proof when $6 \leq n \leq 10$

When  $6 \leq n \leq 10$  the convergence  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} \rightarrow 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and the smooth pointwise estimates on  $\varphi_k$  allow us to estimate:

## End of the proof when $6 \leq n \leq 10$

When  $6 \leq n \leq 10$  the convergence  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} \rightarrow 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and the smooth pointwise estimates on  $\varphi_k$  allow us to estimate:

$$\Lambda_1(\mathbb{S}^n, [g_k]) - \Lambda_1(\mathbb{S}^n, [g_0]) \geq -C \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} \mu_{1,k}^{2\alpha} \quad (\dagger)$$

for some  $C > 0$  independent of  $k$ , where  $\varepsilon_{\alpha,k} \sim \|\nabla^\alpha(g_k - g_0)\|_\infty^2$ .

## End of the proof when $6 \leq n \leq 10$

When  $6 \leq n \leq 10$  the convergence  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} \rightarrow 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and the smooth pointwise estimates on  $\varphi_k$  allow us to estimate:

$$\Lambda_1(\mathbb{S}^n, [g_k]) - \Lambda_1(\mathbb{S}^n, [g_0]) \geq -C \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} \mu_{1,k}^{2\alpha} \quad (\dagger)$$

for some  $C > 0$  independent of  $k$ , where  $\varepsilon_{\alpha,k} \sim \|\nabla^\alpha(g_k - g_0)\|_\infty^2$ .

The contradiction follows from finding a better competitor for  $\Lambda_1(\mathbb{S}^n, [g_k])$ .

## End of the proof when $6 \leq n \leq 10$

When  $6 \leq n \leq 10$  the convergence  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} \rightarrow 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and the smooth pointwise estimates on  $\varphi_k$  allow us to estimate:

$$\Lambda_1(\mathbb{S}^n, [g_k]) - \Lambda_1(\mathbb{S}^n, [g_0]) \geq -C \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} \mu_{1,k}^{2\alpha} \quad (\dagger)$$

for some  $C > 0$  independent of  $k$ , where  $\varepsilon_{\alpha,k} \sim \|\nabla^\alpha(g_k - g_0)\|_\infty^2$ .

The contradiction follows from finding a better competitor for  $\Lambda_1(\mathbb{S}^n, [g_k])$ . Replace  $\mu_{1,k}$  by  $\theta\mu_{1,k}$ ,  $\theta > 1$  in  $B_{1,k}$ . Involved test-function computations based on [Khuri-Marques-Schoen '08] show that

$$\Lambda_1(\mathbb{S}^n, [g_k]) - \Lambda_1(\mathbb{S}^n, [g_0]) \leq -C' \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} (\theta\mu_{1,k})^{2\alpha}$$

which contradicts  $(\dagger)$  for  $\theta \gg 1$ .

## End of the proof when $6 \leq n \leq 10$

When  $6 \leq n \leq 10$  the convergence  $\Lambda_2(\mathbb{S}^n, [g_k])^{\frac{n}{2}} \rightarrow 2\Lambda_1(\mathbb{S}^n, [g_0])^{\frac{n}{2}}$  and the smooth pointwise estimates on  $\varphi_k$  allow us to estimate:

$$\Lambda_1(\mathbb{S}^n, [g_k]) - \Lambda_1(\mathbb{S}^n, [g_0]) \geq -C \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} \mu_{1,k}^{2\alpha} \quad (\dagger)$$

for some  $C > 0$  independent of  $k$ , where  $\varepsilon_{\alpha,k} \sim \|\nabla^\alpha(g_k - g_0)\|_\infty^2$ .

The contradiction follows from finding a better competitor for  $\Lambda_1(\mathbb{S}^n, [g_k])$ . Replace  $\mu_{1,k}$  by  $\theta\mu_{1,k}$ ,  $\theta > 1$  in  $B_{1,k}$ . Involved test-function computations based on [Khuri-Marques-Schoen '08] show that

$$\Lambda_1(\mathbb{S}^n, [g_k]) - \Lambda_1(\mathbb{S}^n, [g_0]) \leq -C' \sum_{\alpha=2}^{\lfloor \frac{n-2}{2} \rfloor} \varepsilon_{\alpha,k} (\theta\mu_{1,k})^{2\alpha}$$

which contradicts  $(\dagger)$  for  $\theta \gg 1$ .

This argument crucially uses that  $\mu_{1,k} \rightarrow 0$ , which is only guaranteed when  $3 \leq n \leq 10$  [P.-Vétois, '22].

Thank you for your attention.

## Euler-Lagrange equation for $\Lambda_2(M, [g])$

Let

$$F(u) = \lambda_2(g_u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}.$$

If  $u_t = u(1 + th)$  for  $|t|$  small enough we have

$$\begin{aligned} \frac{d}{dt} \Big|_{t=0+} F(u) &= \inf_{\varphi \in E_2(u)} \left( - (2^* - 2) \lambda_2(g_u) \frac{\int_M u^{2^*-2} h \varphi^2 dv_g}{\int_M u^{2^*-2} \varphi^2 dv_g} \right) \\ &\quad + (2^* - 2) \lambda_2(g_u) \int_M u^{2^*} h dv_g \end{aligned}$$

$$\begin{aligned} \frac{d}{dt} \Big|_{t=0-} F(u) &= \sup_{\varphi \in E_2(u)} \left( - (2^* - 2) \lambda_2(g_u) \frac{\int_M u^{2^*-2} h \varphi^2 dv_g}{\int_M u^{2^*-2} \varphi^2 dv_g} \right) \\ &\quad + (2^* - 2) \lambda_2(g_u) \int_M u^{2^*} h dv_g \end{aligned}$$

The fact that  $u$  is a **minimiser** and  $\lambda_2(g_u) > 0$  implies  $\dim E_2(u) = 1$ .

# Euler-Lagrange equation for $\Lambda_k(M, [g])$ , $k \geq 2$

Let

$$F(u) = \lambda_k(g_u) \left( \int_M u^{\frac{2n}{n-2}} dv_g \right)^{\frac{2}{n}}$$

and assume  $u$  attains  $\inf_{u>0} F(u)$ .

Then there exists  $\varphi_1, \dots, \varphi_k$  generalised eigenvectors associated to  $\lambda_k(u)$  and  $d_1, \dots, d_k$  nonnegative numbers with  $\sum_{i=1}^k d_i = 1$  such that

$$u^2 = \sum_{i=1}^k d_i \varphi_i^2 \quad \text{in } M.$$

## Conformal eigenvalues in different contexts

That minimisers of  $\Lambda_2(M, [g])$  have one-dimensional eigenspaces is deeply related to the minimisation problem and to the fact that there is a spectral gap.

The situation is very different from the **maximisation** of the eigenvalues of **the laplacian** in [Nadirashvili-Sire '15], [Pétrides '18, '22], [Karpukhin-Stern '20, '22]. There extremals in a conformal class yield in general harmonic maps into some sphere by eigenfunctions and extremals over all metrics (in dimension 2) yield minimal immersions into some sphere. This is likely to be the case for extremals of  $\Lambda_k(M, [g])$ ,  $k \geq 3$ .

**On manifolds with **negative Yamabe invariant** (so  $\Lambda_1(M, [g]) < 0$ ):** the second negative eigenvalue of  $L_g$  can be **maximised** in a conformal class [Gursky-Pérez Ayala '21]. Extremals  $u$  yield either a sign-changing solutions of Yamabe or harmonic mappings from  $M \setminus \{u = 0\}$  into a sphere.
